

Enterprise **WebView**

The WebView module, a Web browser client application using Microsoft ASP.NET technology, provides quick and convenient access to selected Xytech Enterprise modules.

BENEFITS

- ▶ **Highly scalable security architecture can handle very large, complex organizations or small, single-site facilities.**
- ▶ **Powerful search features right at your fingertips.**
- ▶ **A menu-driven system that is flexible and integrates with other Web-based modules.**
- ▶ **One click displays all open (future) bookings.**
- ▶ **Easy navigation backward and forward in time.**
- ▶ **Easily update the scheduled work order time or transaction time.**
- ▶ **The WebView module is designed to minimize any training necessary.**

WebView Benefits

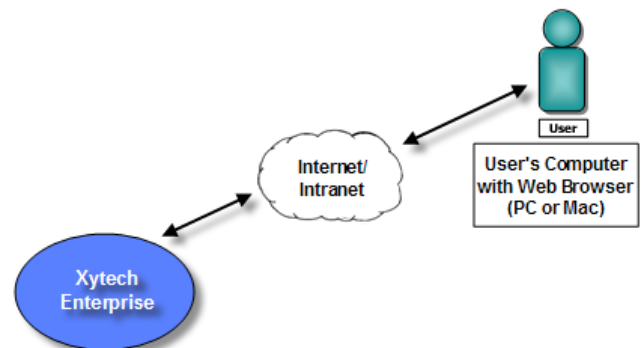

The menu-driven system of the WebView module is easy-to-use and integrates with other Web-based modules. Menus may be customized by each user for a more efficient user experience. Users can redefine all system prompts and even change the display to a language other than the default language. Speed is a great asset and the WebView module is fast, and limitations have been built into the system to prevent the accidental selection of large amounts of data.

WebView Applications

The WebView module allows users to access information from several Xytech Enterprise applications. Jobs may be searched and displayed with the option to drill down to individual work orders and transactions. Work order and job notes are easily updated and a Job Cost report can be displayed, which lists amounts invoiced and not invoiced by billing code along with totals.

Users may also directly access work order and transaction information. Specific users can be configured to allow work order times and notes to be updated, along with the ability to add or view work order attachments. Work order resources and times are displayed and the resource time may be updated

Powerful searches are available in the Phone List providing the ability to search for customers, vendors, employees, freelancers, or any other name or company in the directory. Users can also search open or closed invoices by number, date, job, etc. You have the ability to drill down to the work order and view details about a specific transaction.

Remote users have easy access to project and schedule information, which are controlled by Xytech Enterprise security settings.

Access to the MetaVault® Library provides users with an enhanced search function with over twenty attributes displayed for both for physical and file based media assets. The result columns displayed may be customized for the user or customer accessing the data. Attachments may be displayed as well to view thumbnails or any other type of file.

The Web Schedule Book

Many tools are built into the system for easy end-user application. Views in the schedule book may be displayed in one-day, three-day, one-week, or one-month views. Display templates are defaulted by user and default the groups and resources displayed, meaning different users see only the schedules that apply to them. Information is readily available so that a user can see bookings, quick holds, vacations, holidays, sick days, and equipment maintenance all displayed in the schedule book. Weekly schedules display as well, which show the in, out, and optionally the meal and break times of each person. In addition, security may be assigned for customer or employee access, assuring your information is safe, and you control access.

Infrastructure

The Xytech Enterprise WebView module runs on Microsoft Internet Information Server v5.0 or later. The Web server requires a secure connection to the Xytech Enterprise SQL database server system.

Required Modules

Enterprise Workflow Management Core System
